The Architecture of Radio is an immersive mobile experience that takes the "infosphere"—the ubiquitous wireless infrastructure that humans have created but can't actually see—and transforms it into a kind of 360-degree blueprint. It hides the stuff we view all the time and highlights the things we've never glimpsed before. GPS-location data let the app know where you are, and from there the world's 7 million cell towers, 19 million Wi-Fi routers, and hundreds of satellites fill in the rest.
